

EMSA

Satellite monitoring of the Mediterranean Sea

IV International Space Forum

Leendert Bal

Head of Operations

05/09/2019

Provides technical and
operational support
to
28 EU Member States
and the Commission

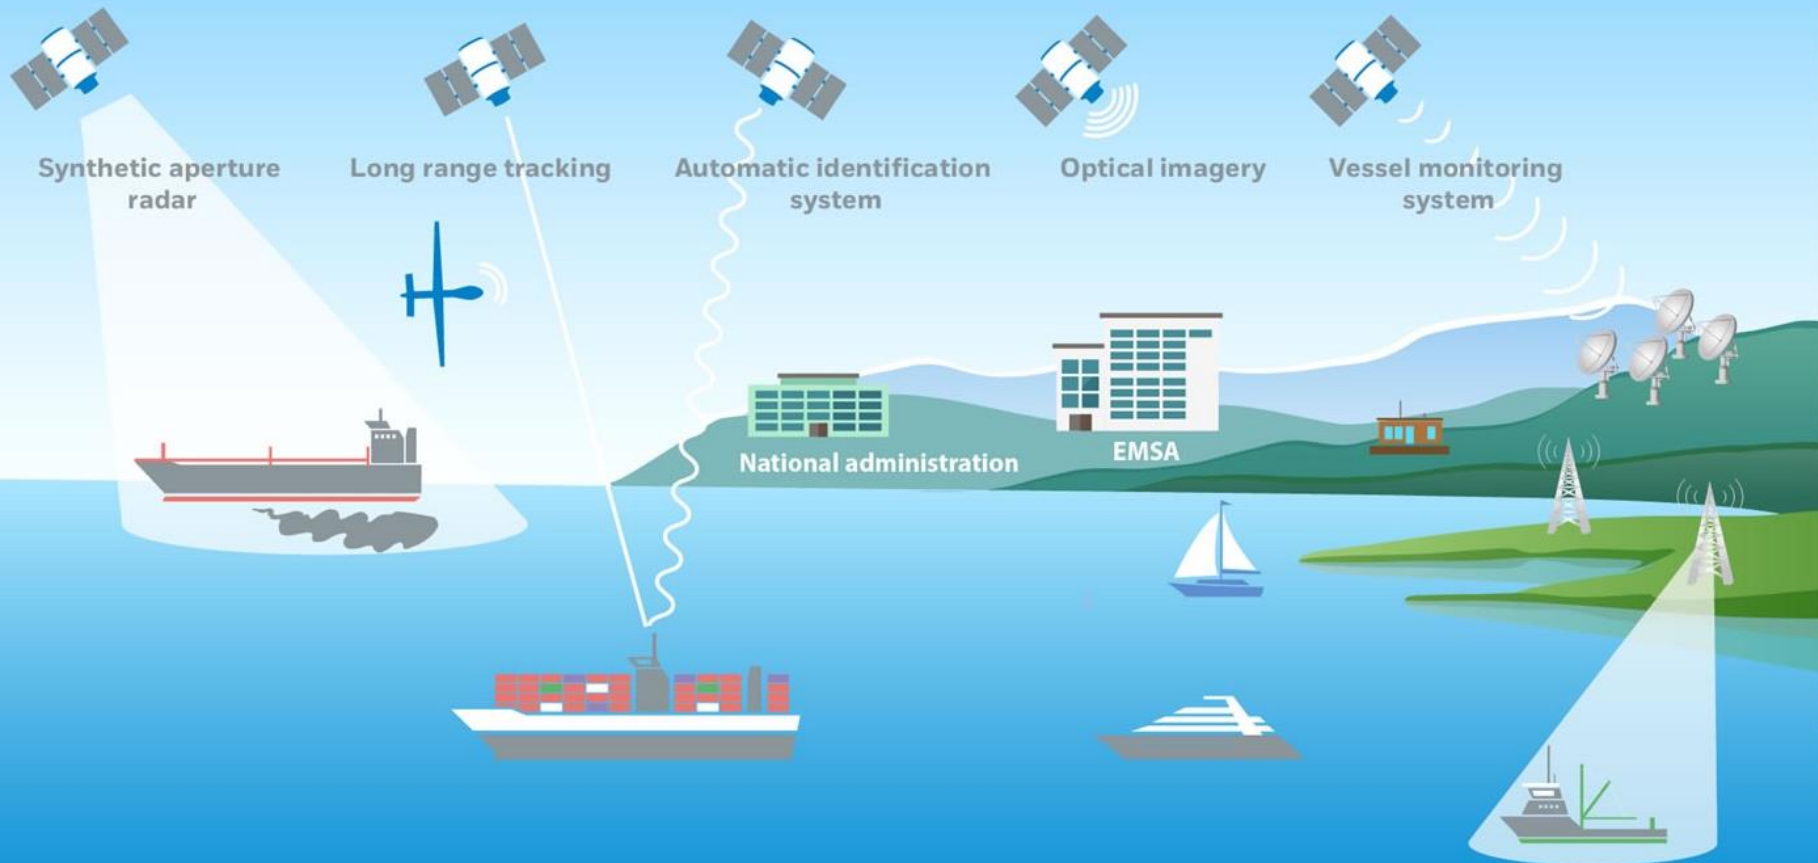

Staff: ~ 250 people
~ 24 nationalities

Annual Budget:
~80 million EUR

Headquarters:
Lisbon, Portugal

Maritime Data Sources

Radar (SAR) Satellites

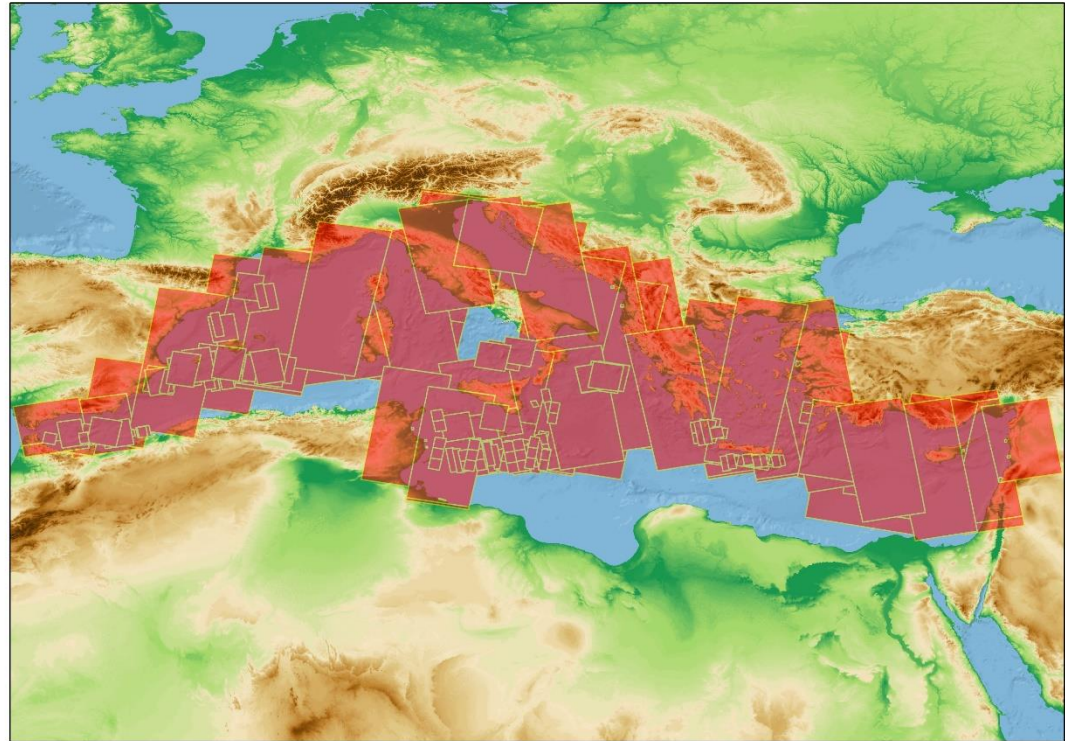

- Access to 6 satellites: *Radarsat-2*, *Sentinel-1A/1B*, *TerraSAR-X*, *TanDEM-X*, *PAZ*
- All weather capability
- Day and night operations
- Broad range of resolutions and coverage
- Quasi real time (20 minutes after satellite pass)

Optical Satellites

- Access to 14 satellites: *GeoEye-1*, *WorldView-1/2/3*, *Pleiades-1A/1B*, *Deimos-2*, *SPOT 6/7*, *SuperView-1/4*, *EROS-B*
- Enable target/activity identification
- Wealth of data in different spectral bands
- Focused on very high resolutions (0.3m to 10m)
- Near real time (30 minutes after satellite pass)

Satellite monitoring

- 400 satellite images delivered
- 35 million km² covered (around 14 times the area of the Mediterranean sea)
- Different satellite images used depending on the function
- Wide range of Member States activities supported

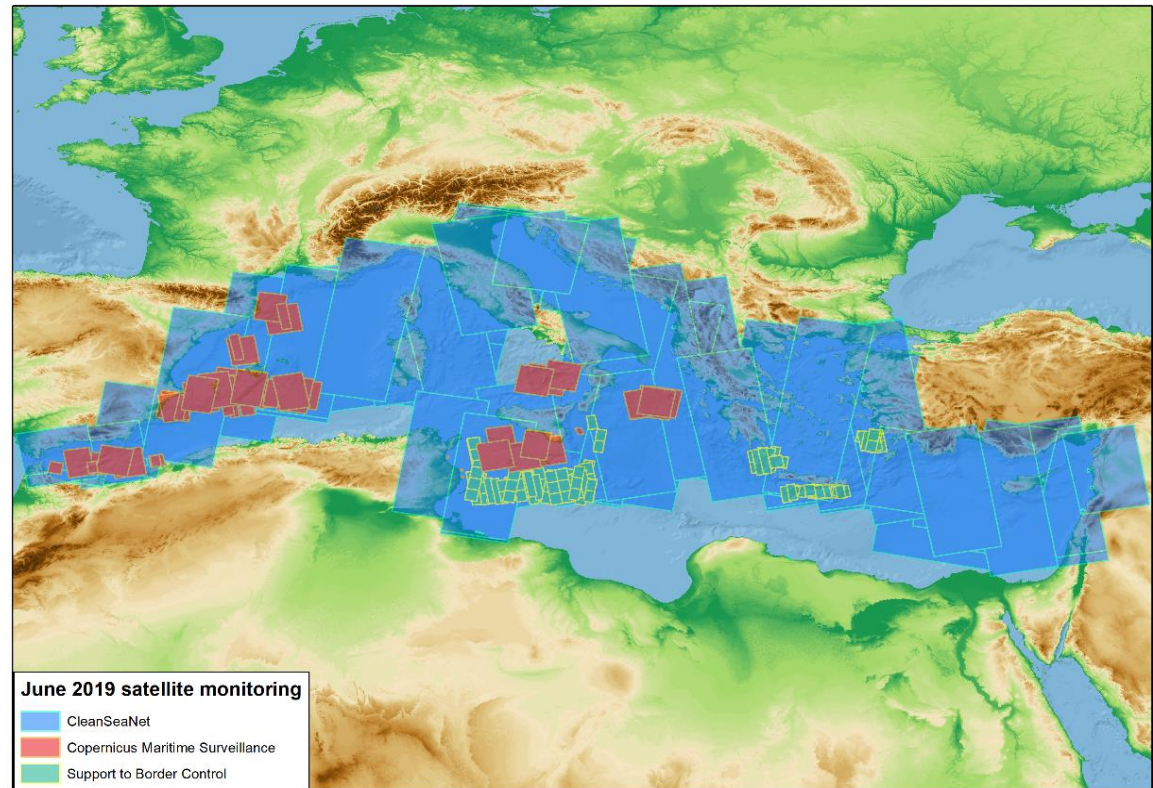

June 2019
Satellite monitoring in the Mediterranean

Mediterranean Sea

Wide range of activities monitored

- **CleanSeaNet**
 - Oil spill monitoring
- **Copernicus**
 - Fisheries control
 - Law enforcement
 - Customs
 - Maritime Safety
- **Support to Border Control**
 - Illegal immigration
 - Search and rescue

Pollution Monitoring

Fisheries Control

Maritime Safety and Security

Law Enforcement

Customs

Border control

Earth Observation Services

Images delivered

Total value expected in 2019
of 20 million Euros

* 2019 forecast

Detection of illegal discharges

- On 6 August 2019 EMSA's CleanSeaNet detected an oil spill in Italian waters
- Italian authorities received the CleanSeaNet alert report after 20 minutes
- Spill was more than 100km long
- Few hours later EMSA's RPAS flight over the spill area
- RPAS verified the satellite detection

Use case: Maritime Safety & Pollution Monitoring

CSL Virginia

Ulysse

- On 07/10/2018, around 08:00 UTC, Tunisian Flagged Passenger/RO-RO cargo *Ulysse* collided with Cypriot flag general cargo *CSL Virginia*.
- EMSA monitored the situation for maritime safety and pollution concerns

Use case: Maritime Safety & Pollution Monitoring

Corsica October 2017

Use case: Support to oil spill response operations

Use Case: Law Enforcement

Suez Bay - September 2017

- Monitor of transshipment operations
- VHR optical used to confirm position of vessels
- 1 ton of heroin was seized

Way forward

Additional radar and optical capacity

“small” radar missions

- Short term missions of “new space” initiatives

Classical radar missions

- Under preparation by “old space” companies

New very high resolution optical missions (30 cm)

Radio Frequency detection

- Ability to detect radio frequencies from space
- Detection capabilities include:
 - AIS emmitters
 - Marine radios (VHF16 and 70)
 - GSM and satellite phones
 - Maritime radar (X-Band)
- Key players
 - Initiatives by new companies

Further integration with non-EO data sources

- Exploiting further synergies with RPAS/HAPS

Enhanced analysis capabilities

- Automatic vessel and oil spill detection/classification using A.I.
- Extract knowledge from existing EO datasets (patterns of life)

- **Maritime Surveillance in the Mediterranean**
 - Space sources are heavily used, added value is proven (see use cases)
- **Satellite data capacity**
 - Sufficient SAR and optical constellations are needed (continuation and diversification needed)
 - New data sources from space will improve quality of the maritime picture (important for verification/validation)
- **Sea + Space = Perfect Partnership**
 - Space data is a necessity for the maritime picture
