SPACE TOMORROW

The Challenge

A Growing Space Economy But Who Gets to Participate?

Africa is launching satellites, building ground infrastructure and using space for development. But access to quality space education career opportunities remains unequal.

Disability

Many learners, including Deaf and blind students, are left out.

Geography

Rural learners have limited access to specialised facilities and expertise.

Language

Most space content is not available in African languages.

Connectivity

Low bandwidth and limited internet access restrict learning.

Talent is everywhere. Opportunity is not.

Stellar Aspirations is changing that.

Stellar Aspirations

Space education for every African learner in your language, for free.

Stellar Aspirations is an inclusive space education and talent-development platform making Africa's growing space economy accessible to the next generation. The platform turns space science, satellite technology, Earth observation, African space missions and AI into practical learning experiences, interactive activities and career pathways for young people.
